

Resume.yii

This app provides a way for users to create/save multiple resumes based on specific job applications. The main feature of the app is curating resumes, from the user's expanded resume, based on the current job application the user is applying towards using generative-ai. The app has a built-in feature to edit saved and curated resumes, including adding and removing experiences and sections in the resume.

Response to Feedback

Feedback given:

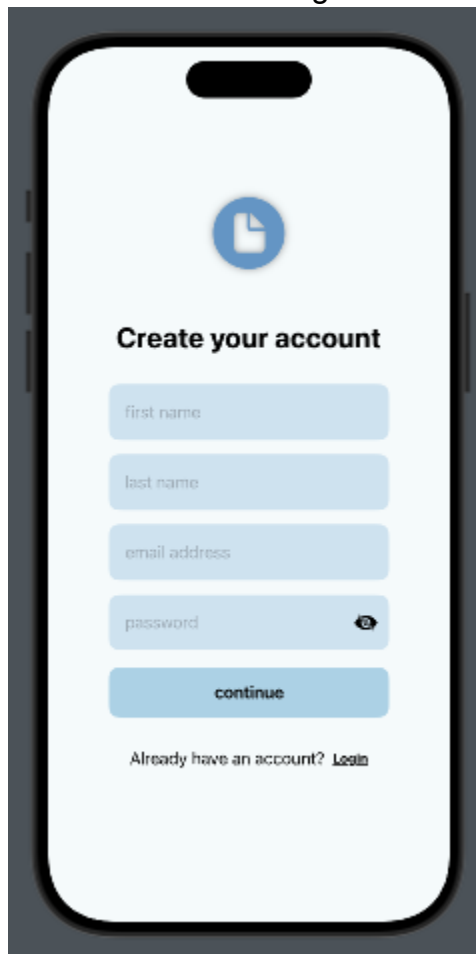

You can directly start with the login page instead of having two buttons in the starting screen. you can have signup button at the bottom. (Check any popular social media apps for reference).

I fixed this by disregarding the page and starting on the login page. Launch the Beta App to see the changes.

Feedback given:

Since you only acquire 4 labels, put them together in a single signup screen.

I have made the changes and here is a screenshot from the SignUpView().

Feedback given:

AI can't be a home screen. The home screen can store the statistics or profile information and resume count.

I'll disagree slightly as the main feature of the app is to generate resumes for the user. If that's not the main home screen, then the user will be confused about the purpose of the app.

Feedback given:

The tab bar color should be separated from the main color.

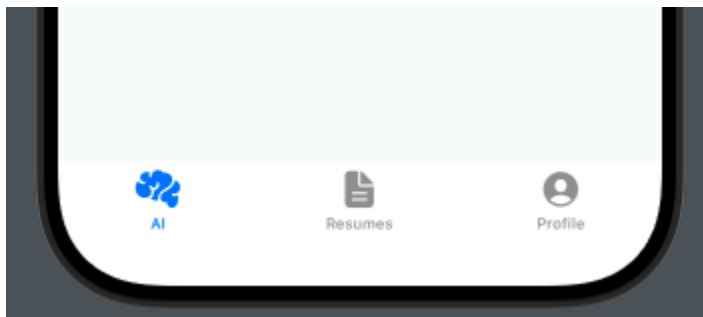

I made a minor color change to the tab bar. It is separate from the main color, however, I will go back and change the color to gray to make it more different from the main color.

Feedback given:

Blue color is for professionalism. Try to change the colors regarding.

I have made the changes to the color Blue. You can see the previous screenshot or launch the Beta App to see the change.

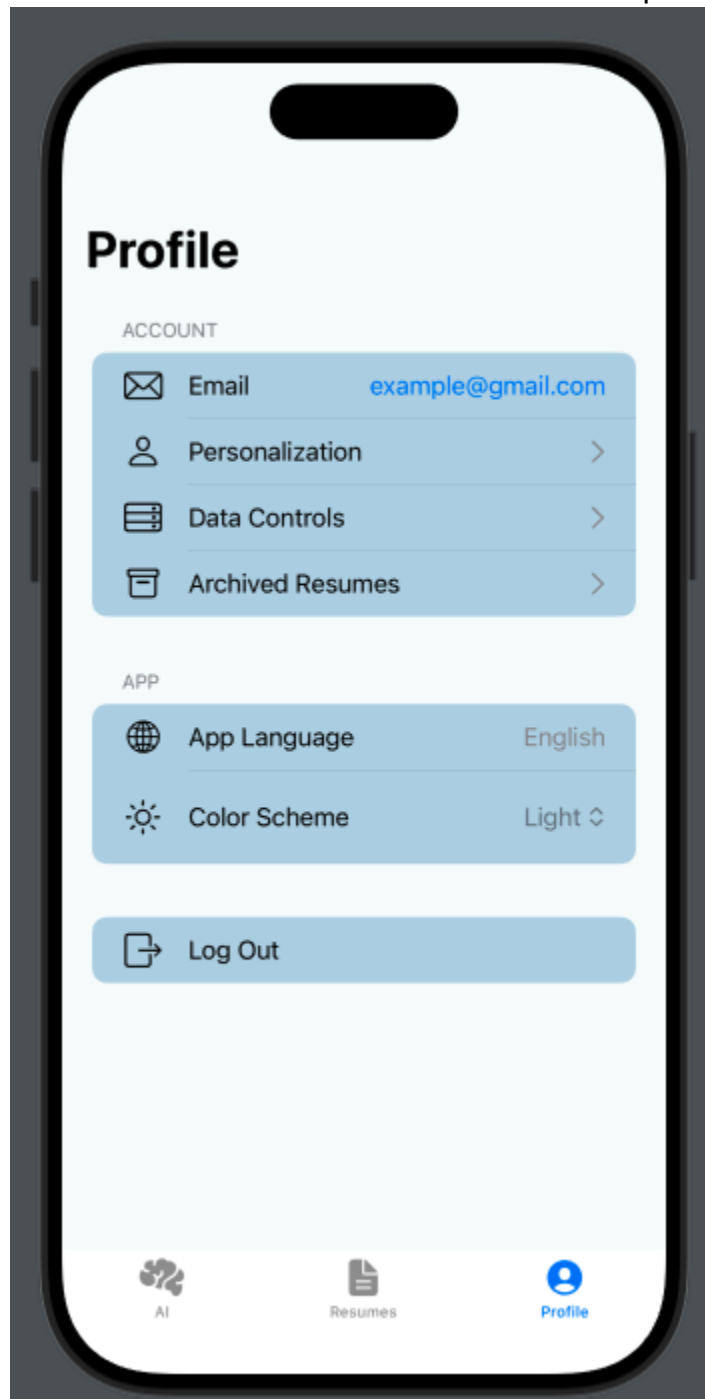

(Note: It is not very noticeable, the tab bar is white and the main color is light shade of gray)

Feedback given:

Move the log out button to the bottom.

I have moved the button to the bottom of the profile page.

Feedback given:

Top icons are not easily pickable in the resume view screen.

I have changed the resume view screen to only have a download button. Viewing the resume will be determined for the Production App as the functional method still needs to be implemented.
